Mirth Connect / Home / Configuration (Official)

Extension Installation

Created by Robert Beckman, last modified by Jacob Brauer on Oct 09, 2013

> Before attempting to install the plugin(s), log in to the Mirth Connect Administrator and create a backup by going to Settings -> Backup Config.

Log in to the Mirth Connect Administrator, click on the link for Extensions, browse for the extension on your local disk, and then select Install. You will have to log out and exit the administrator and then stop and start the Mirth Connect Service for the changes to take effect. If you are running a Mirth Appliance, you can restart the service by going to Applications -> Applications Control from the Web UI and clicking the Stop and then Start buttons for Mirth Connect. Once you have restarted the Mirth Connect service, launch the Mirth Connect Administrator again. This will automatically download the new extension(s) you installed and allow you to log in. After logging in again, you can verify that the extension(s) were installed correctly by going back to the Extensions page and checking the applicable Installed Connectors and Installed Plugins tables.

You should be able to find tabs for the User Roles/Authorization and SSL Manager plugins under the Settings page. For the Channel History plugin, simply right click a channel from the Channels view and select View History.

> If you have any issues launching the Mirth Connect Administrator or seeing the installed extensions, try clearing your Java cache (see: http://www.java.com/en/download/help/plugin_cache.xml).
